

Two equal summaries, strictly different finite-budget risk

a Resource-realizable nesting

Specific comparison	Capacity 3	Capacity 4
Known-model gains (q, A, B)	(.05, .10, 19/60)	(.05, .10, 19/60)
Terminal execution at T = 12	$12\rho_\theta$	$12\rho_\theta$
Max fixed-instance coefficient	0.498692	0.498692
Joint safe measurement sortie	Not feasible	Feasible

Equality concerns $\max_{\theta} C_{\theta}$, not every C_{θ} .

Exact anchor certificates, not sampled learning curves. Terminal execution equality: charger-terminal policies.

b Certified bounds at T = 12

Capacity 3: lower bound

 ≥ 0.271625

Gap ≥ 0.056509

Capacity 4: upper bound

 ≤ 0.215116
