

Same summaries. Different finite-budget learning risk.

a Equal summaries; richer safe feedback

Known-model gains agree

(q, A, B): (.05, .10, 19/60) at both capacities

Maximal fixed-instance coefficient agrees

0.498692 at both capacities

Capacity 3

dock, A, B

Joint route unavailable

Capacity 4

dock, A, B

+ joint AB / BA sortie

b Certified risk bounds at $T = 12$

Equality concerns the maximum coefficient, not every instance or full asymptotic geometry.

Exact certificates, not learning curves. Known-model charger-terminal value: $12\rho_\theta$ at both capacities.
